No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                          Score

Analysis of the genetic basis of GS has allowed 2 forms to be identified. One is a mild form cassociated with a homozygous 2 bp insertion in the TMATA sequence upstream of the UGT1*1 exon 1, and the other is a more severe form cassociated with heterozygosity for a mutation which, when homozygous, causes Crigler-Najjartype 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from CS, which is benign, may have altered metabolism of some drugs, making it clificult to determine if an effect is due to the drug or the syndrome. CD rug trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on CS basis of them possessing or not possessing GS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

Insertion in the TATA sequence upstream of the UGT1*1 exon 1, and the other is a more severe form associated with heterozygosity for a mutation which, when homozygous, causes CTIqler-Najjar type 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from GS, which is benign, may have altered metabolism of some drugs, making it difficult to determine if an effect is due to the drug or the syndrome. Drug trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on basis of them possessing GS. In this case, screening involves PCR amplification of the UGT gene, using the primers described in AAT79541-44.
                                                                                                                                                                                                  This sequence represents the upstream sequence, positions -611 to 9 in the patent, of uridine diphosphate glucuronosyltransferase (UGT) gene 1*1 exon 1. This gene is known to be associated with Gilbert's syndrome (GS). GS is a mild, common form of unconjugated hyperbilirubinaemia associated with reduced bilirubin glucuronidation capacity, Analysis of the genetic basis of GS has allowed 2 forms to I dentified one is a mild form associated with a homozygous 2 bp identified one is a mild form associated with a homozygous 2 bp
                                                                                                                                                                                                                                                                                                                                                          improving drug trial efficiency comprises identifying participants
with Gilbert's syndrome - useful as their altered drug metabolism
may hinder result interpretation

The present invention describes an in vitro method of ct diagnosis of a disease in an animal. The method comprises determining cc the genotype of an interleukin-6 (IL-6) gene in the animal. The cc invention also describes; (1) a method of identifying an animal cc predisposed or susceptible to a disease, comprising determining the cc genotype of an IL-6 gene in the animal; (2) a composition for use in cd diagnosing a disease in an animal, the composition comprising one or cc more primer nucleic acid molecules adapted to amplify a portion of a cr use in identifying an animal predisposed or susceptible to a composition comprising one or more primer nucleic acid molecules adapted to amplify a portion of a cc disease, the composition comprising one or more primer nucleic acid condecules adapted to amplify a portion of an CC included the animal. The method can be used for the diagnosis of cor identifying predisposition or susceptibility to a disease, comparison or susceptibility to a disease,

                         Human Alport syndrome oligonucleotide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           likelihood of developing disease.

Antibodies specific for the proteins encoded by the genes in the target list, can be used similarly. Identification of a core group of genes associated with disease, makes possible the use of genetic profiling as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the genomic profile of an individual, particularly for;

(a) prognosis and management of disease (or determining susceptibility to disease);

(b) predicting a patient's response to therapy and symptom profiles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           target genes associated with particular diseases. The mutant variant represented by this sequence gives rise to Alport syndrome phenotype. The specification lists approximately 2500 genes that are target groups for the nucleotide probes of the invention. The probes are used to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is an collagen IV alpha 3 deletion mutant fragment. The mutated gene is an example of a variant that can be detected using timew nucleotide probes of the invention. The probes consist of complementary DNA or RNA for the detection of variants in a group of
                                                                                  08-MAR-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 27 BP; 7 A; 10 C; 3 G; 7 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleotide probes used in genetic screens for determining genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-JUN-1999;

CC of target genes associated with particular diseases. Detected variants of group care mutations or polymorphisms. Included in the Specification are lists of genes for the following target groups: (i) ADME (absorption, case distribution, metabolism and elimination - about 1000 genes). (ii) oncology (about 1200 genes); (iii) central nervous system (about CC 1100 genes); (vi) behavioural (about 250 genes); (vii) psychoses and case genes); (vi) demential (about 700 genes); (vii) psychoses and case genes); (vii) immunology (about 1100 genes); (vii) psychoses and endorrine (about 1100 genes); (xii) development (about 200 genes); (xiii) skin, bone and muscle (about 1300 genes); (xiv) metabolism can dendorrine (about 1100 genes); (xiv) headache (about 250 genes); and genemic profile of an individual, particularly for; (a) prognosis and case (b) predicting a patient's response to therapy and symptom profiles; (c) for health screening; (d) to develop new strategies for therapy and condels, e.g. of the likelihood of developing disease. The present and case of the present and oligonucleotide used to illustrate a deletion in an example from the present invention.

New isolated human polynucleotides

WPI; 1999-430243/36 Stache-Crain B, Jones LW, Kassam A, Ke Lamson G, Leshkowitz D,

families selected from 4 transmembrane segments integral membrane proteins, 7 transmembrane receptors, ATPases associated with various transcription factors, GAAA), eukaryotic aspartyl proteases, GAAA family of diacyldiycerol binding proteins, protein alpha subunit, phorbolesters or protein tyrosine phosphatase, trypsin, wnt family of developmental encoded polypeptides also have a functional domain selected from Ank promodomain, Eg-hand, SH3 domain, WD domain/G-beta repeats, zinc finger (CCHC class), and zinc-binding metalloprotease by screening for differential expression in colon cancer, breast cancer and lung cancer cell lines. The polynucleotides of the invention are represented in AAX98275-X99118 and encode polypeptides of protein This invention describes novel isolated human polynucleotides obtained Claim 1; Page 375; 591pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        domain. The polynucleotides encode polypeptides with similarity to known protein families and are predicted to have similar properties. The novel polynucleotides can be used to develop products for use as therapeutic agents and in forensics, genetic analysis, mapping and diagnostic applications. In particular, the product can be used for the detection and management of cancers. They can be used for treating e.g. cervical cancers, melanomas, colorectal adenocarcinomas, Wilm's tumour, sarcomas, retinoblastoma, myosarcomas, lung carcinomas, leukemias, such as chronic myelogenous leukemia, and lymphomas such as histiccytic lymphoma, anhydric chereditary ectodermal dysplasia, congenital alveolar dysplasia, cepithelial dysplasia of the cervix, fibrous dysplasia of bone, and congenital dysplasia of the cervix, fibrous dysplasia of bone, and congenital dysplasia of the cervix, fibrous dysplasia of bone, and congenital dysplasia of the cervix, fibrous dysplasia of bone, and congenital dysplasia of the cervix fibrous dysplasia of bone, and congenital dysplasia, hyperplasias, e.g. endometrial, adrenal, breast, and prostate or thyroid hyperplasias or pseudoepitheliomatous hyperplasia of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

The present sequence is that of CDNA encoding human Goodpasture antiqen (GP) DeltaIII/V (see ANY95921), an alternative form of human GP resulting from splicing out of exons III and V. The CDNA was obtained by subcloning a CDNA encoding the protein into a modified pETLED vector including an initiator Met. The invention relates to novel Goodpasture antique binding proteins (GPBPs, see ANY95900-11), which bind to and phosphorylate the unique N-terminal region of human GP, and which are highly expressed in several
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cDNA was obtained by subcloning a cDNA encoding the protein into a modified pETISb vector including an initiator Met. The invention relates to novel Goodpasture antigen binding proteins (GPBPs, see AAY95900-11), which bind to and phosphorylate the unique N-terminal region of human GP, and which are highly expressed in several autoimmune conditions. Claimed methods for treating an autoimmune disorder, cell appotosis or a tumour involve modifying the expression or activity of GPBP, especially using a GP-derived peptide, such as GPDeltaIII/IV/V or a nucleic acid sequence.
                                                                                                                                                      Claim 25; Page 154-155; 158pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ទួខ្លួនខ្លួន
       The present sequence is that of cDNA encoding human Goodpasture antigen (GP) DeltaIII (see AAY95919), i.e. an alternative form of human GP resulting from splicing out of exon III. The cDNA was pET15b vector including a cDNA encoding the protein into a modified to novel Goodpasture antigen binding proteins (GPBEs, see AAY95900-11), which bind to and phosphorylate the unique N-terminal autolimmune conditions. Claimed methods for treating an autolimmune conditions. Claimed methods for treating an autolimmune expression or activity of GPBPP, especially using a GP-derived nanotical another and another treating and autolimmune conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                      The present sequence is that of cDNA encoding human Goodpasture antigen (GP) Deltay (see AAY95918), i.e. an alternative form of human GP resulting from splitcing out of exon V. The CDNA was obtained by subcloning a cDNA encoding the protein into a modified perils vector including an initiator Met. The invention relates to novel Goodpasture antigen binding proteins (GPBPs, see AAY95900-11), which bind to and phosphorylate the unique N-terminal autolmmune conditions. Claimed methods for treating an autoimmune

carcinomas, sarcomas, rhabdomyossrcoma, retinoblastoma, Ewing sarcoma, neuroblastoma, osteosarcoma or leukaemia). These are also applicable to treating non-tumourigenic diseases and conditions with accompanying undesired angiogenesis, e.g. diabetic retinopathy, rheumatoid arthritis, retinal neovascularisation, choroidal neovascularisation, muscular degeneration, corneal graft rejection, vitamin A deficiency, atopic contribution, corneal graft rejection, vitamin A deficiency, atopic contributions.
                                                                                                                                                                                                                                                                                                    This sequence encodes a human type IV collagen alpha chain monomer, designated alpha3(IV)NC1. The invention relates to a method for inhibiting angiogenesis, tumour growth or metastases, or endothelial cell interactions with the extracellular matrix, comprising contacting the cells or tissue with a polypeptide composition containing antagonists of specific integrin receptors. The methods and the antagonists are useful for inhibiting and receptors.
                                                                                                                                                                                                                          useful for treating diseases and conditions with accompanying undesired anglogenesis, e.g. solid and bicod-borne tumours (e.g. melanomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 17c;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of antagonists of specific integrin receptors for inhibiting angiogenesis, tumour growth or metastases, or endothelial cell interactions with the extracellular matrix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Brooks P, Hudson B;

                                                                                                                                                                                                                                                                                                                                                                                                                                       cc same genes in one or more second filamentous fungal cells. Monitoring ct the global expression of genes from FF cells allows the production of discovered, possible functions of unknown open reading frames can be considered. The expression of genes can be used to study how FF cells and genes in culture conditions, environmental stress, spore compingenesis, recombination, metabolic or catabolic pathway can be engineering. Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an CC engineering. Using ESTs provides several advantages over genomic or cataray equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate canalysis of the results. AAF07478 to AAF11247 represents ESTs from Aspergillus oryzae; and CC niger; AAF11854 to AAF11858 represents ESTs from Aspergillus oryzae; and CC AAF14879 to AAF11853 represents ESTs from Trichoderma reesei, which are call generated and call the results and in the recent formation of the series which are

```
pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  hits satisfying chosen parameters:

Submitted (12-APR-2000) to the EMBL/GenBank/DDBJ databases

This sequence is a single read and was generated as part of a large

scale clone-end sequencing project of the Tetraodon nigroviridis

genome. For more information, please take a look at

http://www.genoscope.coms.fr/Tetraodon.
